Pfizer and the National Newspaper Publishers Association  
Collaborate to Raise Awareness of Sickle Cell Disease and Need  
for Improved Patient Care

Collaboration Aims to Educate on the Importance of Clinical  
Trials in Developing Potential New Sickle Cell Disease  
Therapies

NEW YORK, NY, March 24 - Pfizer Inc. (NYSE:PFE) and the  
National Newspaper Publishers Association (NNPA), a trade  
association of more than 200 African-American-owned community  
newspapers from around the United States, are collaborating to  
raise awareness of sickle cell disease, a lifelong and  
debilitating genetic disorder that affects red blood cells.

People with rare diseases, like sickle cell disease, have unique  
and complex challenges. The first initiative under the  
collaboration will be a national poll, conducted in partnership  
with Howard University’s Interdisciplinary Research Team in  
Washington, DC. The goal is to assess the awareness of sickle  
cell disease, the challenges of living with the disease, and the  
importance of clinical trial participation in helping  
researchers succeed in developing potential new treatments. In a  
review of 174 sickle cell disease trials, difficulty enrolling  
patients was the stated cause in nearly half of the 30% of the  
trials that were terminated early.¹

“This collaboration with Pfizer provides an opportunity for NNPA  
to inform and educate the readers of our 211-member Black-owned  
newspapers in more than 70 markets across the country on sickle  
cell disease, an often misunderstood disease that has a profound  
impact on the health and well-being of those affected,” said Dr.
Benjamin F. Chavis, Jr., NNPA President. “Together with Pfizer, we look forward to providing sickle cell disease education that can underscore the importance of improving quality of care in the community.”

Sickle cell disease is the most common inherited blood disorder in the United States, affecting nearly 100,000 Americans.² Although it affects many different ethnic groups, the majority of people with sickle cell disease are of African descent.³ In the United States, sickle cell disease occurs in approximately 1 out of every 365 African-American births.⁴ Access to care and delivery of innovative treatments prove to be among the most significant challenges faced by people living with sickle cell disease in America.

“At Pfizer, we are committed to delivering life-changing therapies to people living with rare diseases, like sickle cell disease,” said Kevin Williams, Chief Medical Officer for Pfizer’s Rare Disease unit. “Our commitment also goes beyond clinical research to supporting the rare disease community through innovative collaborations. Working together, we hope to improve awareness and ultimately address the unmet medical needs of sickle cell disease patients.”

The poll results and information about sickle cell disease will be shared with the NNPA network and incorporated into educational programs at NNPA events. More information about sickle cell disease can be found at www.pfizer.com/health-and-wellness/health-topics/sickle-cell-disease. For more information about the NNPA, please visit www.nnpa.org.
