ENVIRONMENT, HEALTH AND SAFETY

All environmental data is baseline adjusted in accordance with the WRI Protocol for reporting GHGs.

1Industry Average = Pharmaceutical Safety Group benchmark.

NOTES

Data scope is directed by Pfizer’s EHS Standards and includes all sites within Pfizer’s operational control. Environmental data from Pfizer’s former Animal Health business is excluded in 2013.

SCOPE

Data scope is directed by Pfizer’s EHS Standards and includes all sites within Pfizer’s operational control. Environmental data from Pfizer’s former Animal Health business is excluded in 2013.

NOTES

1Industry Average = Pharmaceutical Safety Group benchmark.

All environmental data is baseline adjusted in accordance with the WRI Protocol for reporting GHGs.
Working together for a healthier world

Non-hazardous waste generation decreased slightly compared to 2012. In 2013, 27.5 million kilograms of non-hazardous waste were generated, a 20% decrease from 2012. The increase in ODP from 2012 to 2013 was the result of releases at a manufacturing site in 2013. Despite this release, from 2010 to 2013 there was a 13% reduction in ODP. In 2013, Pfizer set its 3rd generation public goal which aims to reduce GHG by 20% by 2020 compared with a 2012 baseline.

Injuries involving 1 or more days away from work. The increase in 2013 was observed in manufacturing operations.

Scope 1: Direct emissions associated with operations including fleet.

Scope 2: Indirect emissions associated with energy consumption.

Our total water withdrawal in 2013 was 4% lower than in 2012. In 2013 Pfizer set a public goal to reduce water withdrawal excluding non-contact cooling water (water withdrawn from and returned to the same source) by 5% by 2020 when compared with a 2012 baseline. Pfizer will continue to optimize performance.

In 2013 Pfizer established a public goal to reduce hazardous and non-hazardous waste disposal 15% by 2020 compared to a 2012 baseline. We made significant progress toward this goal in 2013, reducing total waste disposal by 10%.

Hazardous waste generation decreased compared to 2012 due to consolidation of operations. 62% of Pfizer’s hazardous waste was recycled, this is the same as the recycling rate in 2012.

Non-hazardous waste generation decreased slightly compared to 2012 due to consolidation of operations. 6.2% of Pfizer’s non-hazardous waste was recycled in 2013, as compared to 64% in 2012.

Pfizer’s Fleet Safety Program has launched in 32 countries and covers approximately 90% of our fleet. Recorded collision rate decreased 2% compared to 2012.

Without lessening risk tolerance, a risk priority ranking tool was used in 2012 and 2013 resulting in fewer onsite assessments than previous years. Where necessary we worked closely with suppliers to provide guidance on Pfizer’s EHS performance expectations.

Increases in production at key manufacturing facilities resulted in an increase in VOC emissions. Emissions represent a very small percentage of total VOC use (<1%).

The increase in ODP from 2012 to 2013 was the result of an unexpected release from refrigeration equipment at a manufacturing site in 2013. Despite this release, from 2010–2013 there was a 13% reduction in ODP. In 2013, reduction in the use of ODS continued.

Settlement costs were paid to address matters where non-compliance with EHS regulation or law was alleged. Per SEC its SEC filings.
